Pre-machining

4-faces grinding

Cubing

- Pre-machining operations carried out in the foundry offer the founder and the machine operator an added advantage.
- For the founder it adds value to the part; for the machine operator it reduces machining time, because there is no finishing to be done.

Siif has developed a pre-machining machine tool for cylinder heads and engine blocks (milling, drilling, etc.).

Like cubic capacity, the pre-machining of parts is a plus point for the foundry.

Many operations can be carried out by the robotised cells or by the equipment integrated in it.
